

THIS WEEK IN CAREGIVING

November 2, 2022

Happy National Family Caregivers Month!

CAREGIVING IN THE NEWS

Informal Caregiver Hours on the Rise, Highlighting Need for Home Care, Respite Services

More than half of working caregivers would change jobs if it meant having access to a family caregiving coordination benefit, roughly two-thirds of workers don't have that access, and 85% say they'd take advantage if their current employer offered such a benefit, according to "Homethrive's 2022 Employee Caregiving Survey."

More individuals are having to take on what's known as the second or third shift — caregiving duties in addition to being employed.

How the Pandemic Made 'Caregiver' the Newest Workplace Identity

In the expansion of diversity efforts at work, one term is seemingly everywhere: caregiver. A recent survey by workplace equity platform Syndio finds that workers with caregiving responsibilities are the fastest-growing category of employee identity groups, with 12% of companies tracking them as such.

Difficulties, Dilemmas, and Joys of Spousal Caregiving and Caretaking

For decades the word "caretaking" was the preferred term for one who looked after a loved one as well as one for whom that was the chosen profession. Over the last thirty years, the term "caregiver" has taken precedence. Still, they are sometimes used interchangeably.

NAC NEWS AND UPDATES

It's important to recognize those with chronic pain and the family caregivers that help care for them. This second installment in the Social Innovations Spotlight Series is written by Dr. Fawn Cothran, PhD, RN, GCNS-BC, FGSA, Hunt Research Director at the National Alliance for Caregiving, and explores those caring for someone with chronic pain and the tools that are available to assist them. [Assessing the Pain of Care Recipients: Tools Available to Family Caregivers](#) utilizes a rapid literature review to identify and discuss the tools available to chronic pain caregivers to assess pain in their care recipient and how these caregivers can be better supported in their role.

NAC Releases New Report: Chronic Disease Family Caregiving Through a Public Health Lens: The Framework for Family Caregiving and Public Health

The National Alliance for Caregiving is proud to present *Chronic Disease Family Caregiving Through a Public Health Lens: The Framework for Family Caregiving and Public Health*, a new report developed with support from The John A. Hartford Foundation and in partnership with the National Association of Chronic Disease Directors (NACDD). This framework outlines policy recommendations, implementation actions and messaging content to help the public health community address the complex needs of America's 53 million family caregivers.

Included in this report:

- A foundation of the framework and background into why it's needed;
- Strategies and recommendations for viewing family caregiving through a public health lens;
- A framework comprised of public health data gathering research, education, and awareness and service coordination and delivery across sectors and siloes;
- Actions for implementing an expanded family caregiver support infrastructure via a pilot program.

Guided by the expertise of state-based chronic disease directors, NAC's report and framework recognizes the importance of caregivers as a vital part of the health care team and that supporting these family caregivers is essential for improving public health outcomes for communities and the nation.

World Carers Conversation 2022 Session Recordings

World Carers Conversation returned May 19, 2022 as a global, virtual event with the support of EMD Serono and Embracing Carers. Innovators, researchers, policymakers and carer advocates from around the globe learned about advancements in the field, got inspired, and made connections that matter for the future of carers everywhere. These recordings cover the primary conversations and topics discussed.

To view the slide deck used in the event, click [here](#). To view the recordings, click below.

[VIEW RECORDINGS](#)

Global Voices of Caregiving: A PhotoVoice Project

As part of the World Carers Conversation 2022, NAC worked with Chief Story Officer Anne Levy and caregivers from around the globe to help them tell their own story through a series of photos. These photos addressed simple questions about being a caregiver, such as what works, what doesn't work, and what a world that embraces and supports caregivers would look like. Each one of these stories is unique to the caregiver's own experience and tells a diverse story of what it's like to care for others, an act which connects us all.

To view and hear these stories, please click on the red button below.

The Circle of Care Guidebook Series

The National Alliance for Caregiving's *Circle of Care* library is a series of guidebooks dedicated to providing resources, support and information to caregivers caring for someone in a specific disease space. Part of an ongoing effort of NAC, these first three guidebooks were developed with the assistance of both patient-advocacy and consumer-facing partners:

- **Circle of Care: A Guidebook for Mental Health Caregivers**
- **Circle of Care: A Guidebook for Caregivers of Children and Adolescents Managing Crohn's Disease**
- **The Circle of Care Guidebook for Caregivers of Children with Rare and/or Serious Diseases**

NAC is proud to lend their expertise on caregiving through these guidebooks. To access the guidebooks for yourself and to share them with other caregivers in your life, please visit the link below.

The Integrative Approach to Alzheimer's Disease

November 3, 2022 | 1:00 PM - 1:30 PM ET | Online

November is Alzheimer's Awareness month and our practice is helping spread the facts about the disease that affects about 50 million people worldwide.

CentreSpringMD invites you to join Dr. Stephanie Grossman, our Alzheimer's specialist, as she discusses:

- Risk factors of the disease
- Preventative measures
- Signs and symptoms
- The Bredesen Program
- Our holistic approach to treatment and management

At the end, there will be a question and answer segment where you can submit your questions to Dr. Grossman. See you there!

2022 National Caregiver Symposium

November 4, 2022 | 1:00 PM - 4:00 PM ET | Online

More than 40 million adults in the US are providing care for a loved one. Whether the tasks are heavy or light, they often can stretch a person's abilities to cope beyond their endurance. Yet, the need does not stop. How does one reconcile caregiving needs with constant physical/emotional exhaustion?

In response to a survey conducted this spring with past attendees, the 2022 Annual ACAP Caregiver Symposium will tackle this issue head-on. This national symposium will address ways to deal with the many stresses of caregiving, burnout, and family dynamics. You'll join hundreds of others in a virtual community to hear from leading caregiving experts, become aware of helpful resources, experience support, and gain new caregiving insights. Last year, more than 500 people attended from 38 US states, the Virgin Isles, Canada, and Great Britain.

To register, click the red button below.

2022 AAH National Acute Care for Elders Conference

November 4, 2022 | 10:00 AM - 1:00 PM ET | Online

The National Acute Care for Elders (ACE) Virtual Conference trains and educates healthcare professionals across Advocate Aurora Health, as well as multiple other health systems across the country and beyond. We will continue to seize the opportunity to use technology and reach more healthcare workers than ever before by offering this conference virtually. By bringing in national speakers from around the world, this conference helps to implement best-practice models of care in our own communities and draws national attention towards the efforts to improve care for vulnerable, older adults.

TARGET AUDIENCE

This course is intended for RNs, MDs, DOs, NP, PT, and other interested health professionals.

LEARNING OBJECTIVES

At the end of this session, learners should be able to:

1. Identify and address the unique vulnerabilities of older adults who are acutely ill or injured.
2. Describe practice improvements to better address the needs of older individuals along the continuum of care.
3. Describe key lessons learned as our health systems prepare to care for populations of older Americans.

Gathering of FASD Parent/Caregiver With Brenda Knight

November 5, 2022 | 1:00 PM - 4:00 PM ET | Online

Brenda Knight, a counseling psychologist and Fetal Alcohol Spectrum Disorders (FASD) mental health specialist in private practice in Vancouver, Canada, offers five decades of experience with families, children, youth and adults living with the diverse mental health challenges often related to sexual, emotional, and physical trauma, and communication differences. Having learned about the psychological issues often experienced by persons diagnosed with FASD, she committed much of her practice to their emotional well-being and mental health care throughout the lifespan. Brenda values sharing her professional knowledge and lived experience with professionals, parents and persons diagnosed with FASD. She is recognized nationally and internationally for her respectful, compassionate and realistic approach to sharing life with persons with FASD.

This three-hour gathering is an opportunity for parents and caregivers of those living with FASD to reflect on and consider approaches to supporting the mental health needs of those they love and care for while reducing risk and optimizing long-term outcomes.

Webinar: Become an Age-Friendly Health System in 2023 with HANYS

November 7, 2022 | 1:00 PM - 2:00 PM ET | Online

HANYS is recruiting teams to join the 2023 New York State Age-Friendly Health Systems Action Community and New York Geriatric Emergency Department Accreditation Collaborative.

The Action Community supports hospitals, health systems and other providers as they implement evidence-based interventions to transform care for older adults using the Institute for Healthcare Improvement's Age-Friendly framework. The American College of Emergency Physicians GEDA collaborative promotes geriatric-focused education, policies and protocols, and quality improvement projects to improve the care of older adults in the ED.

During the webinar, attendees will hear IHI and DOH representatives share the value becoming age-friendly can bring to your patients and clinicians. Past Action Community/Accreditation Collaborative teams will also be present to speak about their participation experience and answer questions. Lastly, HANYS staff will outline next steps for those that want to participate, including how to enroll and apply for funding.

This event is open to HANYS members and non-members.

Championing Caregivers

November is **#NationalFamilyCaregiversMonth**! Caregiving can feel at times like a thankless job. Join this workshop where we will take a closer look at resources available to those who give that extra care, as well as offer tips for self-care, advocacy, and ways to de-stress.

Championing Caregivers: Celebrating National Family Caregivers Month

November 9, 2022 | 12:00 PM - 12:45 PM ET | Online

November is National Family Caregivers Month.

Caregiving can feel at times like a thankless job. This November, we celebrate those who lovingly take on extra everyday tasks for those who may not be able to do so for themselves. Whether it's bathing; cleaning; cooking; shopping; or comforting family or the friends we consider family, caregivers need our support too. These individuals often dedicate much of their free time caring for others. This workshop will take a closer look at resources available to those who give that extra care, as well as offer tips for self-care, advocacy, and ways to de-stress.

Virtual Presentation via Zoom

Audience: Caregivers and Friends & Family of Caregivers

Duration: 45 Minutes

Hosted by: Glenn Ellis, MPH, CHCE

To register for this event, click the red button below.

Caregivers of Wounded, Ill, Injured Service Members and Veterans

November 10, 2022 | 8:00 PM - 9:00 PM ET | Online

Developed in collaboration with the Elizabeth Dole Foundation to address the unique needs of non-professional caregivers of service members and veterans. The activities aim to help participants address three common concerns among military caregivers: isolation, identity challenges and maintaining personal wellness.

Service to the Armed Forces Workshops: The American Red Cross Service to the Armed Forces division offers free virtual workshops aimed to build resiliency among our service members, veterans, and their family members. This live discussion is facilitated by a licensed mental health professional from our Service to the Armed Forces team. You will have an opportunity to share with others, learn and practice new skills, and ask questions in a small online group.

If you have any questions about this workshop or any of our other Service to the Armed Forces activities (emergency communications, resiliency workshops, financial assistance, information and referrals, casework, volunteer opportunities, etc.) please contact our Hero Care Center at 877-272-7337, redcross.org/herocarenetwork, or access the Hero Care mobile app. The app can be downloaded by searching for American Red Cross in the Apple App Store and the Google Play Store for Android or by going to redcross.org/mobileapps

REGISTER

National Family Caregivers Month Twitter Chat

November 16, 2022 | 1:00 PM - 2:00 PM ET | Online

Please join the National Academy for State Health Policy for a Twitter chat in recognition of National Family Caregivers Month, co-hosted by The John A. Hartford Foundation and the **National Alliance for Caregiving**.

Each year, around 53 million people provide a broad range of assistance to support the health, quality of life, and independence of someone close to them. An estimated one in six individuals is a family caregiver, and more than two-thirds of people will need assistance with tasks as they age.

The [2022 National Strategy to Support Family Caregivers](#) lays out actions to increase recognition and support for family caregivers. This Twitter chat will explore actions and strategies that states, local governments, employers, and community organizations can take to implement the National Strategy.

To join the conversation, make sure you follow [@NASHPhealth](#) on Twitter and use the hashtag **#RAISEchat**.

For additional information about the chat, click the red button below.

How to Take Care of Yourself while Taking Care of Others

November 17, 2022 | 7:00 PM - 8:00 PM ET | Online

Almost everyone will find themselves in the role of caregiver at some point in their lives. Whether it is for a child, a spouse, a parent, or other relative or friend, the responsibilities of caregiving can be challenging.

Join the Katz Institute for Women's Health for an in-depth guide to how you can preserve your own well-being as you care for others.

To register for this event, click the red button below.

Webinar: Insights into Young Carers

November 17, 2022 | 8:00 PM - 10:00 PM ET | Online

This free, two-hour interactive webinar presented by the Carer Knowledge Exchange will feature emerging evidence and discussion on the impact that being a young carer has on carers' health and wellbeing.

Designed for a wide audience, evidence presented will include research findings, evidence-based practice, and the lived experience of caring to raise awareness of young carers' experiences.

The webinar will be interactive and enable participants to share their own ideas and experiences on the topic of young carer health and wellbeing.

To register for this event, click the red button below.

Social Engagement and Mental Health: Successful Programs and Interventions

November 18, 2022 | 1:00 PM - 2:00 PM ET | Online

Join engAGED: The National Resource Center for Engaging Older Adults for a webinar focused on the intersection of social engagement and mental health. During the webinar, the Illinois Coalition on Mental Health and Aging will provide a primer on how remaining socially engaged and connected positively impacts mental health and what organizations interested in developing programs that address social engagement and mental health should know with regard to potential partners and coalition building. Attendees will also hear from Rogue Valley Council of Governments Area Agency on Aging and the University of Rochester Medical Center on programs and interventions that promote social engagement and positive mental health outcomes.

To register for this event, click the red button below.

Hearing Voices That Are Distressing Simulation Workshop

November 21, 2022 | 10:30 AM - 1:30 PM ET | Online

****Facilitated for people 18+ with access to a computer. Not recommended for those who are hearing voices.****

This simulated workshop accurately portrays what someone who hears voices lives with every day, promoting a powerful understanding and awareness of the "hearing voices" experience. For caregivers, family members, workplaces, college/universities, paramedics, law enforcement and professional service providers who work with people who hear distressing voices. Participants will listen to recordings of voices through headphones connected to audio players while performing various tasks as the volume is adjusted.

The learning goals are:

- Understanding the day-to-day challenges that people face who hear voices.
- Becoming more empathic toward people who hear distressing voices.
- Changing clinical practices to better address the needs of people who hear distressing voices.

To register for this event, click the red button below.

Understanding Agitation - A Responsive Behaviour

November 28, 2022 | 2:30 PM - 4:00 PM ET | Online

Agitation is a responsive behaviour that can be seen in individuals living with Alzheimer disease and other forms of dementia. It is stressful to the person living with dementia, their families, and care providers, and can result in faster progression of the illness and even higher rate of death! Managing agitation of Alzheimer has been a major challenge with difficulty finding the right approach to improve the symptoms and reduce the risk of harm.

In this discussion hosted by the [Alzheimer Society of Durham](#) in Ontario, we will clarify the definition of agitation, factors that can contribute to it and describe best practices to manage it. Also, we will share information about the latest research geared towards optimizing the care for agitation of Alzheimer disease in the community, in long term care and in the hospital.

To register for this event, click the red button below.

DEMENTIA CONNECTION
INSTITUTE

A New Model of Care: Dementia Connection Model

December 9, 2022 | 1:00 PM - 2:00 PM ET | Online

Learn about a new model of care called the Dementia Connection Model and walk away with a number of tools for your caregiver toolbox!

In this dementia care webinar, you will learn about the first-ever cognitive-behavioral approach to care called the Dementia Connection Model[®], created by Dr. Jennifer Stelter, clinical psychologist, dementia expert, and Johns Hopkins Press author of *The Busy Caregiver's Guide to Advanced Alzheimer Disease*. The model ties together three key concepts in understanding Alzheimer's disease and other forms of dementia and how to provide the best quality of care. You will better understand the "why?" of dementia to provide a quality of life for those you care for. Then, you will exercise your brain in learning "how" to best implement the "what" - sensory-based, non-pharmacological approaches that positively influence the emotions and memories for those living with dementia, enabling positive, productive behavior expressions and a better connection.

You can earn 1 FREE continuing education (CE) credit, after completing the webinar evaluation.

Communication & Behavior: The Language of Dementia

December 15, 2022 | 12:00 PM - 1:00 PM ET | Online

The communication changes that accompany dementia can present a host of challenges. As verbal language fades, nonverbal and behavior become more prominent methods to express thoughts, wants and needs. This webinar will review common changes that occur and learn strategies that can be easily utilized to promote understanding.

To register for this event, click the red button below.

JANUARY

CONFIDENCE ¡CONFIANZA!

CONFIDENCE Financial Education Program

Thursdays, January 19 - February 16, 2023, 5:00 PM – 7:00 PM ET | Online

Join the University of Southern California Family Caregiver Support Program for a virtual program designed to help Latino and Hispanic family caregivers to persons living with Alzheimer's disease or a related dementia lower the out-of-pocket costs of caregiving. Over 5 weeks, caregivers will meet virtually and gather in group sessions led by a trained facilitator to discuss: how to navigate community resources, strategies for seeking help, how to balance employment and caregiving, and more!

Sessions will take place over Zoom video conference. Below are the scheduled dates and times:

- January 19, from 5:00-7:00 PM ET
- January 26, from 5:00-7:00 PM ET
- February 2, from 5:00-7:00 PM ET
- February 9, from 5:00-7:00 PM ET
- February 16, from 5:00-7:00 PM ET

To register for this event, click the red button below.

PATIENT AND CAREGIVER STUDIES

The Alzheimer Prevention Trials (APT) Webstudy

Start: December 20, 2017

End: April 30, 2023

Enrollment: 20,0000

The Alzheimer Prevention Trials (APT) Webstudy is an online registry designed to accelerate enrollment for Alzheimer's disease clinical trials by identifying and tracking individuals who may be at higher risk for developing Alzheimer's dementia.

The APT Webstudy monitors volunteers who are 50 and older for changes in their memory through a series of quarterly, no-cost memory tests. It takes place online, without any in-person visits required. APT Webstudy researchers use the results to track volunteers'

memory and, based on potential risk level, invite select volunteers to participate in other Alzheimer's research studies.

Participants in the Webstudy, will receive:

- Access to secure, web-based tools to assess your brain's cognitive function over time;
- A personalized dashboard with insights into your own memory based on test results;
- The potential opportunity to participate in comprehensive memory evaluations at one of our nationwide clinical sites; and
- The potential opportunity to participate in clinical trials to prevent Alzheimer's disease.

To learn more or sign up, click on the red button below.

[LEARN MORE OR ENROLL](#)

Mindcrowd Memory Test

MindCrowd is an online research study to understand the factors that influence how the human brain functions. Specifically, MindCrowd researchers want to know how the way people remember things might change as they age. If researchers better understand the way memory changes as people age, they may be able to understand what changes occur in people who have an age-related brain disease that affects their memory (like Alzheimer's disease and other dementias).

Participants will take one attention test and one memory test, and answer a few study-related questions. The online memory test takes approximately 10 minutes to complete.

Participant test results show how they performed compared to all of those who have taken the MindCrowd memory and attention test so far. MindCrowd is testing only a small fraction of each participant's overall cognitive performance. The MindCrowd test results reflect each individual's performance for that specific cognitive domain and do not indicate overall ability or intelligence.

[PARTICIPATE](#)

AHEAD Study

Start: July 13, 2020
End: October 25, 2027
Enrollment: 1400

The AHEAD Study is an exciting step in the fight against Alzheimer's disease. This trial, funded by the National Institutes of Health (NIH) and Eisai Inc., aims to help prevent Alzheimer's disease by testing an investigational treatment aimed at delaying memory loss before noticeable signs of Alzheimer's disease begin.

The AHEAD Study tests whether an investigational treatment can slow or stop the earliest brain changes due to Alzheimer's disease in people with a higher risk of developing the disease later in life. It is an opportunity to work with world-renowned experts to carefully monitor your brain health at no cost and take advantage of the latest advances made in treatment.

The AHEAD Study is the first of its kind to:

- Enroll participants as young as 55 years old who are at risk of developing symptoms of Alzheimer's disease as they get older;
- Use a blood test to rule out people not likely to be eligible based on amyloid PET imaging;
- Target the earliest changes in the brain due to Alzheimer's disease by enrolling participants with intermediate levels of brain amyloid;
- Use an approach that tailors dose levels of the investigational treatment to study participants' brain amyloid levels;
- Test an investigational treatment that has been shown to lower brain amyloid in people with symptoms of Alzheimer's.

To see if you're eligible to participate, click on the red button below.

Brain Stimulation Through Smell for People With Early-Stage Alzheimer's Disease

Start: November 8, 2021
End: April 30, 2023
Enrollment: 200

Preliminary research suggests that stimulating the parts of the brain that sense smell, called the olfactory regions, may help reduce some brain changes associated with Alzheimer's disease. This study will test whether daily treatment with computerized olfactory training (COT), which uses a portable device to deliver task training along with timed exposure to the scent of essential oils, improves cognitive and daily functioning. Potential participants will be screened for amyloid, a protein associated with Alzheimer's disease, using a PET brain scan or a cerebral spinal fluid test.

Amyloid-positive participants will be randomly assigned to receive COT using either the therapeutic essential oils or a placebo scent. The participant's caregiver will administer COT to the participant at home for 45 minutes each day for six months. Researchers will assess changes in memory and cognitive function, brain structure, smell sensitivity, and other measures related to the participant's quality of life and daily functioning at the start of the study, and after six and nine months.

Minimum Age: 65 Years

Maximum Age: 85 Years

Must have:

- Probable mild Alzheimer's disease with:
 - Mini-Mental State Examination score of 21 to 27
 - Clinical Dementia Rating score of 1
 - Presence of amyloid deposits, based on analysis of the cerebral spinal fluid or a PET brain scan
- Females must be postmenopausal for at least two years
- Available study partner with normal cognitive function

Must NOT have:

- Any significant neurologic disease other than Alzheimer's disease
- MRI evidence of infection or blood vessel damage
- Significant nasal disease
- Any unstable medical condition
- Major psychiatric disorder or substance use disorder within the past two years
- Any condition that may make having an MRI unsafe (e.g., metal implant, cardiac pacemaker, epilepsy, severe claustrophobia, morbid obesity)
- Treatment with any drug designed to slow the progression of Alzheimer's disease in the past six months
- Use of prohibited medications, including antipsychotics, anticholinergics, anticonvulsants, other antidepressants, benzodiazepines or other psychotropic medications, and blood thinners (a low dose of aspirin is acceptable)

Health and Cognitive Effects of Dementia Caregiving in Black Male Caregivers

This study will examine the effects of dementia caregiver burden on cognitive function and physical health in Black American male caregivers. Participants will complete questionnaires, surveys, and memory and thinking tests. Researchers will also collect saliva samples to measure stress levels. Many of the research activities will be completed over the telephone. The results of this study will inform the development of support measures and treatment options for Black American men as primary caregivers of a person with dementia.

Do I Qualify To Participate in This Study?

Minimum Age: 30
Maximum Age: 85

Must have:

- Living with a close family member, friend, or other person with dementia and providing more than 10 hours of care each week
- Care recipient has a diagnosis of progressive dementia
- Able to speak, read, and write English

Must NOT have:

- Paid professional caregiver
- Significant medical or neurological disease (e.g., major organ failure, insulin-dependent diabetes, alcoholism, or sleep disorder)
- Significant, untreated depression; stable dosing with serotonin reuptake inhibitors is acceptable
- Use of medications that may interfere with the study, particularly those that may affect central nervous system function or physical measurements (e.g., antipsychotics or steroids)
- Significant visual impairment

To learn more or sign up, contact Robert Turner by clicking on the red button below.

Communication in the Family

You are invited to be interviewed about your experiences and communication patterns as someone who currently (or in the past) cares for your family member living with Alzheimer's disease or another related dementia (ADRD). There are potentially things you are uncertain about regarding caring for your family member, and we are interested in how you communicate to manage these uncertainties. Uncertainty means the inability to predict what will happen or the unknown. For example, you might worry about your loved one's well-being because their dementia makes their behavior unpredictable.

You are eligible if you:

- Are at least 18 years old
- Used to or currently help care for one of your family members who lives/d with ADRD (by care, this includes but is not limited to: Eating, bathing, transferring, managing finances, medications, chores, shopping, etc.)

If you are interested, please click the red button below to get started on scheduling your interview and answering some demographic questions.

SmartPrompt Electronic Reminder Aid to Improve Everyday Function in People With Dementia

What Is This Study About?

SmartPrompt is a smartphone application designed for older adults with difficulties remembering to do daily tasks because of cognitive impairment. In this study, older adults with mild dementia and their care partners will be trained to use SmartPrompt and then

asked to use the application to perform a target task, such as drinking water, eating meals, or taking medications in their homes twice per day for two weeks. Researchers will investigate whether the reminder application is effective in helping adults with dementia work around sensory and motor challenges to complete tasks.

Must have:

Participants With Dementia

- At least 65 years old
- Fluent in English
- Diagnosis of mild dementia
- Mild-level cognitive impairment as measured by a tool such as the Mini-Mental State Exam
- Availability of a caregiver

Caregivers

- 18 years or older
- Fluent in English
- Resides with or has daily contact with the person with dementia
- Cognitively healthy with no diagnosis of dementia or other major health problems that would stop them from providing reliable information and participating in the study

Must NOT have:

Participants With Dementia

- History of severe psychiatric disorder (e.g., schizophrenia and bipolar disorder) and/or nervous system infections or disorders (e.g., epilepsy, brain tumor, large-vessel stroke, and major head trauma)
- Major intellectual disability
- Current metabolic or systemic disorders (e.g., B12 deficiency, renal failure, and cancer)
- Severe sensory deficits, such as blindness or total hearing loss, that would interfere with viewing a smartphone or other everyday objects or with hearing the task directions
- Severe motor weakness that would not allow the use of a smartphone or other everyday objects (e.g., paralysis or severe deformities of both arms)

The Relationship Between Uncertainty Associated with Patient's Delirium and Psychological Distress Among Family Caregivers in the Intensive Care Unit

This research study is a part of a Ph.D. thesis project conducted by Amal Haji Assa, a Ph.D. student at The University of Tennessee Health Science Center, Memphis.

What is this study about?

This study is about family caregivers' experience and feelings when witnessing sudden cognitive and mental changes (known as delirium) in their loved ones during the ICU stay.

Who can participate?

- Adults 18 years or older
- Family caregiver of a patient who had been admitted to the ICU and had witnessed delirium symptoms on their loved ones during ICU stay.

Research Procedures:

This survey will take approximately 20-25 minutes to complete. You will have access to the survey link that will first ask you to determine if you are eligible to take the survey (screening form) and then to answer a series of questions regarding the following information:

1. General information about you such as your age.
2. Your loved one's general information.
3. Information about how you know about delirium in the ICU.
4. Information about how seeing delirium in your loved one affected you.

In appreciation for your participation and completion of the forms, you will be compensated for your time.

To learn more or sign up, contact Amal Haji Assa by clicking on the red button below.

Home-Based Music Therapy for Mild Cognitive Impairment and Alzheimer's Disease

What Is This Study About?

Listening to music or singing songs may provide emotional and behavioral benefits for people with dementia. In this one-year study, researchers will evaluate the effects of home-based music therapy for people with mild cognitive impairment or Alzheimer's disease. If assigned to the treatment group, participants and their study partner will be asked to sing songs at home for at least one hour each day. In addition, some participants will meet with a music therapist several times over a six-month period. Every three months, the researchers will gather information from participants to track changes on cognitive function and quality of life. Screening and participation in this study can be completed in-person or remotely from home.

Do I Qualify To Participate in This Study?

Minimum Age: 55 Years

Maximum Age: N/A

Must have:

- Diagnosis of Alzheimer's disease or mild cognitive impairment
- Availability of a study partner to join music therapy sessions
- English speaking
- No verbal impairment
- Must have computer with a video camera or smart phone
-

Must NOT have:

- Diagnosis of dementia other than Alzheimer's disease
- Diagnosis of probable Alzheimer's disease with Down syndrome
- History of a clinically significant stroke with lasting effects on cognition
- Current evidence or history in past two years of epilepsy, focal brain lesion, or head injury
- Current diagnosis for a major psychiatric disorder including psychosis, major depression, bipolar disorder, alcohol or substance abuse
- Conditions causing disability that would interfere with study intervention such as pain or life expectancy less than one year
- Living in a nursing facility or other dementia care center
- Current participation in another research study

**Online Support and Skills Training
for Dementia Caregivers**

Stress related to caregiving can lead to depression, anxiety, social isolation, financial strain, and health issues. This study will test the effectiveness of GamePlan4Care, an online education and skills training program for dementia caregivers, to reduce stress and caregiver burden and improve caregiver well-being. Participants will be randomly assigned to either the GamePlan4Care program or another online support program for six months. Participants will also be assigned to a dementia care specialist who will encourage engagement and follow up after the training with phone calls for a six-month period.

Do I Qualify To Participate in This Study?

Minimum Age: 18 Years

Maximum Age: N/A

Must have:

- Provides at least eight hours, on average, of weekly care or supervision for a friend or family member with symptoms or a diagnosis of Alzheimer's disease or a related dementia
- Access to the internet at least three times per week, on average
- Lives within the Texas recruitment area in one of the following counties: Bastrop, Bell, Blanco, Burnet, Caldwell, Coryell, Fayette, Hamilton, Hays, Lampasas, Lee, Llano, Milam, Mills, San Saba, Travis, Williamson
- English-speaking

Must NOT have:

- Current participation in another caregiving study or evidence-based caregiver program
- Previous participation in any study designed to collect information for development of the GP4C program

engAGED Year Three Poll

The National Resource Center for Engaging Older Adults (engAGED) would like to learn about programs offered by caregiving organizations that specifically address social isolation, loneliness or social engagement. To this end, engAGED is conducting a poll from November 1 to December 2 to learn more about social engagement programs currently offered by Aging Network and partner organizations. This is part of our Year Three project workplan, and builds upon an engAGED poll conducted in 2020.

Responses to this poll will help engAGED learn more about social engagement programs currently offered by Aging Network and partner organizations, including types of programs, partners involved, populations and communities served and outcome measurements. The

results from this poll will be used to develop a fact sheet depicting social engagement program trends across the Aging Network and partner organizations.

engAGED is asking partner organizations to promote the poll widely to their networks and have provided a dissemination toolkit that contains sample social media and newsletter language along with sample images. To access the toolkit, click [here](#).

Questions? Contact info@engagingolderadults.org.

Hospital Discharge Planning: A Guide for Families and Caregivers

A trip to the hospital can be an intimidating event for patients and their families. As a caregiver, you are focused completely on your family member or friend's medical care, and so is the hospital staff. You might not be giving much thought to what will happen when your friend or family member leaves the hospital.

Everything about this transition – whether the discharge is to home, a short-term rehabilitation (“rehab”) center, or a residential nursing facility – is critical to the health and well-being of the person you care for. Yet, while it's a significant part of the overall care plan, there is a surprising lack of consistency in both the quality and process of discharge planning across the health care system.

To learn more, click the red button below.

Alzheimer's Disease Research Centers: National Research Centers, Local Resources

The Alzheimer's Disease Research Centers (ADRCs) offer local resources, support, and opportunities to participate in research on Alzheimer's disease and related dementias. These centers are dedicated to developing and testing new ways to detect, diagnose,

treat, and prevent dementia and to improving care for people with these diseases and their families. The National Institute on Aging (NIA) at the National Institutes of Health (NIH) funds more than 30 ADRCs at medical institutions across the country. Each center has specific scientific and population areas of focus.

For families affected by Alzheimer's and related dementias, ADRCs offer:

- Help with obtaining diagnosis and managing your care
- Information about the diseases, services, and resources
- Opportunities for volunteers to participate in clinical trials and studies that contribute to improved understanding of dementia, which may lead to new treatments and better care
- Support groups and other special programs for volunteers and their families

Just released: 2022 National Strategy to Support Family Caregivers

2022 National Strategy to Support Family Caregivers

The National Alliance for Caregiving – a coalition of 67 national organizations – applauds the release of the 2022 National Strategy to Support Family Caregivers developed by the U.S. Department of Health and Human Services but urges strong accountability and implementation efforts to turn the strategy into action.

The strategy details more than 350 federal actions and 150 measures that state and local governments, public health departments, philanthropies, and community-based, faith-based, and nonprofit organizations can take immediately to support the nation's 53 million family caregivers who make up 21% of the population.

The National Strategy includes potential government actions that address issues that family caregivers say are most important, including:

- 1) **Access to Respite Services**
- 2) **Support with Day-to-Day and Complex Medical Tasks**
- 3) **Inclusion of Caregivers in Care Teams**
- 4) **Financial Education on Caregiving Costs**

- 5) **Better Identification of Family Caregivers**
- 6) **Research on the Needs of Family Caregivers**

NAC was integral to mobilizing the caregiving community in support of the RAISE (Recognize, Assist, Include, Support, and Engage) Act, which established the council and process for developing the 2022 National Strategy to Support Family Caregivers. NAC also worked with The John A. Hartford Foundation and the National Academy for State Health Policy to ensure family caregivers were centered in the development of the recommendations and that the strategy reflected the lived experiences of this diverse community.

We encourage individuals and organizations to **provide public comment** on the National Strategy. The Strategy will be updated biennially, informed in part by public feedback, ensuring it continues to meet the needs of family caregivers and those they care for as they evolve.

Vaccinations and Older Adults

When fall arrives, many of us know it’s time to get the annual flu, or influenza, shot. It’s also a good time to consider what other vaccines or boosters to get to protect your health.

Staying up to date on vaccines is especially important for older adults. Our immune system helps the body fight infection, but it gets weaker as we age. Vaccines help to strengthen the immune system.

Other vaccines that are important to older adults include COVID-19, pneumonia, shingles, and TDP (tetanus, diphtheria, and pertussis).

Hearing Loss and Older Adults

Hearing loss is a sudden or gradual decrease in how well you can hear. It is one of the most common conditions affecting older and elderly adults. Approximately one in three people between the ages of 65 and 74 has hearing loss and nearly half of those older than 75 have difficulty hearing. Having trouble hearing can make it hard to understand and follow a doctor's advice, to respond to warnings, and to hear doorbells and alarms. It can also make it hard to enjoy talking with friends and family. All of this can be frustrating, embarrassing, and even dangerous.

Six Tips To Help Prevent Falls

The risk of falling increases with age. Falls can be especially dangerous for older adults, often causing fractures, hospitalization, and disability. More than one in four people age 65 years or older fall each year, yet many falls can be prevented. The good news is that many falls are avoidable.

To learn more preventing falls, click the red button below.

Watch: How Alzheimer's Changes the Brain

How Biomarkers Help Diagnose Dementia

Biomarkers are measurable indicators of what's happening in the body. These can be found in blood, other body fluids, organs, and tissues. Some can even be measured digitally. Biomarkers can help doctors and researchers track healthy processes, diagnose diseases and other health conditions, monitor responses to medication, and identify health risks in a person. For example, an increased level of cholesterol in the blood is a biomarker for heart attack risk.

Before the early 2000s, the only sure way to know whether a person had [Alzheimer's disease or another form of dementia](#) was after death through autopsy. But thanks to advances in research, tests are now available to help doctors and researchers see biomarkers associated with dementia in a living person.

CONVERGENCE

Convergence Dialogue on Reimagining Care for Older Adult Adults

In a new report, Convergence Center for Policy Resolution released recommendations from its Convergence Dialogue on Reimagining Care for Older Adults. The report offers consensus solutions produced by leaders and experts who participated from across the political spectrum in a multi-stage convening. These unlikely allies propose changes to America's systems of care that reflect the unique needs and realities of aging adults today and in the future.

Brain Stimulation Can Affect Memory in Older Adults

The number of older adults worldwide is rising, along with an increase in age-related memory decline. Researchers have long sought ways to prevent or reverse memory impairment. They've been able to pinpoint specific brain circuits and networks that underlie learning and memory. But effective and lasting interventions to improve memory have remained elusive.

Genetic Risk Factors that Underlie Depression May Also Drive Alzheimer's Disease

Some cases of Alzheimer's disease may be driven by the genetic risk factors that can underlie depression, according to an NIA-supported data-mining study by researchers at Emory University School of Medicine. The results, published in *Biological Psychiatry*,

suggest that the activity of at least seven genes may help explain why depression appears to increase the chances one may experience Alzheimer's.

To learn more about the connection between depression and Alzheimer's disease, click the red button below.

Exposure to Green Space May Boost Cognitive Health

Residential areas with more green space were associated with faster thinking, better attention, and higher overall cognitive function in middle-aged women, according to an NIA-funded study. Published in JAMA Network Open, the findings suggest that green space — such as trees, flowers, grass, gardens, and parks — could be explored as a potential community-based approach to improving cognitive health.

Memory, Forgetfulness, and Aging: What's Normal and What's Not?

Many older adults worry about their memory and other thinking abilities. For example, they might be concerned about taking longer than before to learn new things, or they may sometimes forget to pay a bill. These changes are usually signs of mild forgetfulness — often a normal part of aging — not serious memory problems.

Click [here](#) to view a brief, animated video explains the difference between normal and serious memory problems.

What Is Frontotemporal Dementia?

Frontotemporal dementia is caused by a group of disorders that gradually damage the brain's frontal and temporal lobes. These damages cause changes in thinking and behaviors. Symptoms can include unusual behaviors, emotional problems, trouble communicating, challenges with work, and difficulty with walking.

Frontotemporal dementia (FTD), sometimes called frontotemporal disorders, is rare and tends to occur at a younger age than other dementias. About 60% of people with frontotemporal dementia are 45 to 64 years old.

Preventing Falls at Home: Room by Room

Many falls happen at home, where we spend much of our time and tend to move around without thinking about our safety. There are many changes you can make to your home that will help prevent falls and better ensure your safety. Try these tips to reduce the risk of falling at home:

- Put automatic night lights in the bathroom and close to the bed.
- Mount grab bars near toilets and on both the inside and outside of the tub and shower.
- Make sure there is good lighting in stairways and hallways, with light switches at the top and bottom of stairs and on each end of a long hall.
- Keep electrical cords near walls and away from walking paths.

What Is Dementia? Symptoms, Types, and Diagnosis

Dementia is the loss of cognitive functioning — thinking, remembering, and reasoning — to such an extent that it interferes with a person's daily life and activities. Some people with dementia cannot control their emotions, and their personalities may change. Dementia ranges in severity from the mildest stage, when it is just beginning to affect a person's functioning, to the most severe stage, when the person must depend completely on others for basic activities of living.

Dementia is more common as people grow older (about one-third of all people age 85 or older may have some form of dementia) but it is not a normal part of aging. Many people live into their 90s and beyond without any signs of dementia.

Partnering with Your Healthcare Provider

A RESOURCE FOR PEOPLE LIVING
WITH MEMORY LOSS AND THEIR
CARE PARTNERS

Partnering with Your Healthcare Provider: A Resource for People Living with Memory Problems and Their Care Partners

The University of Washington Dementia Palliative Education Network and the WA State Dementia Action Collaborative have created a new free toolkit for family/friend care partners of people living with dementia.

The goal of this toolkit is to:

- Explain how to form a working partnership with healthcare providers
- Show how to organize, streamline tasks, and communicate about the care needs of the person living with dementia
- Reduce chances of avoidable care transitions

The toolkit includes:

- Easy-to-navigate narrated presentation
- Video scenario demonstrations
- Care, medication, and appointment log sheets

For more information about the toolkit, click [here](#). To view the flyer, click the red button below.

New Report on Impact of Caregiver Shortages on Older Adults, Area Agencies on Aging

New data from USAging shows that existing shortages in the caregiving workforce have grown during the COVID-19 pandemic—posing a significant threat to the ability of older adults to age well in their homes.

Caregiver Needed: How the Nation's Workforce Shortages Make It Harder to Age Well at Home, a new report from USAging, reveals that many AAAs and their direct care provider partners across the country are facing workforce shortages which threatens their ability to provide home and community-based services to older adults who depend on them.

Caring for People with Serious Illness

The COVID-19 pandemic has highlighted existing weaknesses in the United States health care system, while creating a new set of challenges related to caring for people with serious illness. The National Academy of Sciences, Engineering, and Medicine's Roundtable on Quality Care for People with Serious Illness hosted a three-part workshop to explore the initial responses to the pandemic by health care teams providing care to people with serious illness, the impact of the pandemic on the health care workforce, the use of telehealth, issues related to clearly communicating with the public about health emergencies, and policy opportunities to improve care for people with serious illness.

Alliance for Aging Research Mental Health Tips

More than 20 percent of older adults aged 60 and over suffer from a mental or neurological disorder. The most common neuropsychiatric conditions are dementia and depression, according to the World Health Organization. Substance-use disorders related to use of alcohol, illicit drugs, and prescription medications are increasing in prevalence among older adults, along with chronic pain issues that may complicate treatment access.

Individuals with Alzheimer's disease (AD) and other dementias are often not diagnosed, despite numerous benefits of early detection including time to explore treatment options and clinical trials, establish a care plan, develop support networks, and plan for the future. As their disease progresses, these patients experience changes in how they communicate as well as significant behavioral changes that can cause depression, anxiety, agitation, apathy, psychosis, and other neuropsychiatric symptoms.

The Alliance for Aging Research offers a variety of tips and information resources on its website for individuals facing these issues and those who care for them.

Assessing Changes in Memory and Function

If you do not see an aging friend or relative often, changes in his or her health may seem dramatic. In contrast, the primary caregiver might not notice such changes or realize that more help, medical treatment, or supervision is needed. Or, the primary caregiver might not want to accept the fact that the health of his or her spouse or parent is failing.

As a caregiver, you can provide support by helping an aging friend or relative get the care they need.

Cloudy Vision? It Could Be Cataracts

Your eyes are your windows to the world. If something clouds them, you may have trouble seeing well enough to read, drive, or do other daily activities.

One common cause of cloudy vision is cataracts. These form in the lens of your eye. Cataracts are a normal part of aging. They occur when proteins in the lens break down over time and clump together.

Midlife Cholesterol and Blood Sugar Levels May be Risk Factors for Alzheimer's Disease

Abnormal cholesterol and glucose (or blood sugar) levels as early as age 35 may be associated with Alzheimer's disease risk later in life. These findings, published in *Alzheimer's & Dementia*, suggest that people with normal cholesterol and glucose measurements in early through middle adulthood may be less likely to develop Alzheimer's as older adults. The study was led by NIA-funded researchers at the Boston University School of Medicine.

Social Stress Contributes to Accelerated Aging of the Immune System, Study Finds

Exposure to social stress was associated with accelerated aging of the immune system, according to an NIA-funded study recently published in PNAS. The body's immune system changes as people age, and there's large variability in these changes. The study, led by researchers at UCLA, investigated whether social stressors added to immune system decline.

IMPACT Lived Experience Panel Releases Two Reports on Research Study Outcomes and Ethics in ePCTs for PLWD and Their Care Partners

Reports from the first two series of meetings with the IMPACT Lived Experience Panel (LEP) are now available on the IMPACT website. The two reports share highlights and insights gained during meetings with the LEP facilitated by IMPACT's Patient Caregiver Relevant Outcomes Core and the Ethics and Regulation Core in the first cycle of the Lived Experience Panel. The LEP reflects a coordinated effort between the IMPACT Collaboratory and the Alzheimer's Association.

[The 2021-2022 Lived Experience Panel Report: Priorities for Person and Caregiver Relevant Outcomes in Dementia Intervention Research](#), by Antonia V. Bennett, PhD, Laura C. Hanson, MD, MPH, Gary Epstein-Lubow, MD, Sheryl Zimmerman, PhD, summarizes the discussions with the Lived Experience Panel and members from the Patient Caregiver Relevant Outcomes Core about research study outcomes that are important to people living with dementia and their care partners.

[The 2021-2022 Lived Experience Panel Report: Ethical Challenges in Conducting Research Using a Waiver of Informed Consent with People Living with Dementia](#), by Emily Largent, PhD, JD, RN, Jason Karlawish, MD Steve Joffe, MD, MPH, Gary Epstein-Lubow, MD, documents the insights gained from two meetings between members of IMPACT's Ethics and Regulation Core and the Lived Experience Panel, featuring conversations regarding the ethical challenges related to conducting embedded pragmatic clinical trials among people living with dementia and their care partners using waivers of informed consent.

Genetic Variant Linked to Parkinson's Found in Immune Cells

NIA researchers discovered that individuals with a DNA variant that has an effect only in an immune cell present in the brain, called microglia, have an increased risk of developing Parkinson's disease. Their study results, published July 27 in *Science Translational Medicine*, suggest scientists should consider cell type when examining possible causes of Parkinson's and other neurodegenerative disorders.
